Hi Adam –
So data collection is complete from our site, and I believe coding should be done too.

Looks like we collected data from 330 participants total (169 for Study 1, 161 for Study 2). In Study 1, we did lose 14 of those participants because they failed the probe, though.

Not sure if there's anything we still need to do to tidy up the results file or not. If so, please let us know and happy to do so!

Did we get you the names of all of research assistants who helped with this already for the contributing author list? If not, let me know and I'll get those to you. My graduate students (CC'd on this email) also helped to set up and coordinate data analysis for this project.

-Ben Wilkowski
University of Wyoming

Hi everyone

Following from the survey results, it seems that a few labs have not done the coding for study 2 correctly (that is, either "gorilla" and "tiger" were coded broadly/non-discretely, or "food" and "diseases" were coded narrowly/discretely). I have sent an individual email to you if you have indicated this in the survey, but if you have not filled in the survey and think you have done it incorrectly, please also get in touch with me asap. Thank you very much.

Best regards
Adam

Hi Irene,

Whatever your lab did, it would be useful to represent it in the survey. I'd greatly appreciate it if you'd take a second to complete it.

Best wishes
Ian

JXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=XcUuEPVnzeO0Xejx6shELWA6mO4vVqaJOK%2BLx1uTB38%3D&reserved=0
>>> <https://aus01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fforms.gle%2FEhBbpgdQz7xham8b9&data=05%7C02%7Cadam.wang%40jcu.edu.au%7C2109b90e2885465a287e08dc4dd363b6%7C30a8c4e81ecd4f148099f73482a7adc0%7C0%7C0%7C638470817523639345%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=eArjE5mDhAQu9NLLUTvm6ghNn9BJEnfPVwJpAZZ1r4o%3D&reserved=0>). It's just two questions,
>>> it should only take you a minute to complete.
>>>
>>> Broadly speaking, we see two main ways of scoring the data:
>>> - Narrow scoring strategy, using utterances of the precise target
>>> word only
>>> - Broad scoring strategy, which counts references to the target
>>> *category* beyond the word itself
>>>
>>> Using a narrow scoring strategy, if the participant said the word
>>> "chocolate" when the target was "food", this would not count as a
>>> mention. Using a broad scoring strategy, it would.
>>>
>>> We suspect that the narrow strategy would be more reliable but
>>> less valid, and the broad category would be less reliable but
>>> possibly more valid. We're going to check this by scoring our
>>> data both ways and checking the reliability and the distribution
>>> of scores between them.
>>>
>>> We'd like to put together this data (i.e., the same data score
>>> two ways) with the results of the survey of how other labs have
>>> already done this (or plan to do it) to get a sense of the
>>> whether not constraining this choice further is likely to
>>> introduce heterogeneity and uncertainty into the effect. Adam has
>>> said that he would not like to ask sites to rescore their data
>>> given the time that this takes. We're conducting this survey and
>>> rescoring of our own data as a potentially useful prior step that
>>> could speak to whether such a rescoring would be useful or needed
>>> (agnostic to whether it is done inside the Wang et al manuscript
>>> or in some follow up).
>>>
>>> Best wishes
>>> Ian & Malte
